

PLANNING LOGIC

Auto Ticket Classification using Flow Designer

1. Planning Overview

The planning logic defines how the project will be developed, tested, documented, and demonstrated. The project is divided into structured stages so that the automation can be configured systematically and validated before final deployment or demonstration.

2. Project Development Logic

Phase	Planning Activity	Expected Output
1. Requirement Analysis	Identify the IT helpdesk problem, users, incident types, and classification requirements.	Problem statement and requirements
2. Solution Design	Design the automated classification workflow and define the system architecture.	Solution architecture and workflow
3. ServiceNow Setup	Configure the ServiceNow Developer Instance and required Incident Management components.	Configured ServiceNow environment
4. Flow Development	Create the Flow Designer workflow with a suitable trigger, conditions, and actions.	Working automation flow
5. Classification Rules	Define rules for common issues such as Network, Hardware, Access, and Performance.	Classification logic
6. Testing	Create sample incidents and verify whether the flow assigns the expected classification.	Test results
7. Documentation	Document the problem, solution, architecture, implementation, testing, and results.	Project documentation
8. Demonstration	Record the complete working process from incident creation to automatic classification.	Final project demo

3. Automation Planning Logic

Incident Created → Flow Triggered → Read Incident Details → Evaluate Conditions → Identify Issue Type → Update Classification → IT Support Processing

4. Classification Planning

Issue Type	Example Keywords / Description	Planned Classification
Network	Wi-Fi, internet, connectivity, network	Network
Access	Password, login, account access	Access / Account
Hardware	Projector, keyboard, mouse, device failure	Hardware

Issue Type	Example Keywords / Description	Planned Classification
Performance	Slow computer, system performance	Performance
Software	Application or software not working	Software

5. Testing Plan

- Create a test incident for each major issue type.
- Verify that the Flow Designer trigger executes correctly.
- Confirm that the configured condition identifies the correct issue type.
- Verify that the incident classification is updated as expected.
- Test multiple descriptions to identify possible classification gaps.

6. Project Completion Criteria

The project will be considered complete when the configured flow successfully processes test incidents, automatically applies the expected classification, and the complete workflow can be demonstrated from incident creation through the final updated incident record.

7. Planned Deliverables

- Problem statement and requirement analysis
- Proposed solution and solution architecture
- Working ServiceNow Flow Designer automation
- Classification rules and test cases
- Final project documentation
- Project demonstration video
