

PROJECT PLANNING TEMPLATE

Auto Ticket Classification using Flow Designer

1. Project Planning Objective

The project plan organizes the development of the ServiceNow automation into clear stages, from requirement analysis and design through implementation, testing, documentation, and final demonstration.

2. Project Plan

No.	Project Activity	Key Tasks	Deliverable / Outcome
1	Ideation	Identify the IT helpdesk problem; brainstorm automation ideas; select the project concept.	Project idea and problem statement
2	Requirement Analysis	Identify users, pain points, incident types, user stories, and system requirements.	Requirement specification
3	Solution Design	Define the proposed solution, workflow, architecture, and classification approach.	Solution design and architecture
4	ServiceNow Setup	Configure the ServiceNow Developer Instance and Incident Management environment.	Ready development environment
5	Flow Development	Create Flow Designer trigger, conditions, and actions for automated classification.	Working automation flow
6	Classification Configuration	Configure rules for Network, Access, Hardware, Performance, Software, and other required types.	Classification rules
7	Testing	Create test incidents, execute the flow, verify classifications, and record results.	Test cases and results
8	Documentation	Prepare project report, FSD, architecture, planning documents, screenshots, and results.	Complete project documentation
9	Demonstration	Record the end-to-end ServiceNow demonstration and explain the workflow and outcome.	Final demo video

3. Project Schedule Template

Week / Stage	Planned Work	Status
Week 1	Ideation and problem definition	Planned / Completed
Week 2	Requirement analysis and solution design	Planned / Completed
Week 3	ServiceNow configuration and Flow Designer development	Planned / Completed
Week 4	Classification rules and workflow testing	Planned / Completed
Week 5	Documentation, screenshots, final testing, and demonstration	Planned / Completed

4. Project Milestones

- **M1:** Problem and requirements finalized.
- **M2:** Solution architecture and workflow finalized.
- **M3:** Flow Designer automation implemented.
- **M4:** Classification logic successfully tested.

- **M5:** Documentation and final demonstration completed.

5. Final Success Criteria

The project is considered successful when the ServiceNow flow can automatically classify representative IT incidents according to the configured rules, the results are verified through testing, and the complete solution can be demonstrated and documented.
