

PROPOSED SOLUTION

Auto Ticket Classification using Flow Designer

1. Solution Overview

The proposed solution is a ServiceNow-based automated incident classification system using Flow Designer. The system automatically evaluates newly created IT helpdesk incidents and assigns an appropriate category based on predefined classification conditions. This reduces the need for IT staff to manually review and categorize every incoming ticket.

2. Proposed Workflow

Step	Process
1	User creates an IT incident in ServiceNow.
2	The incident is captured in the Incident Management module.
3	Flow Designer is triggered automatically.
4	The flow evaluates the incident information using configured conditions.
5	The matching issue type is identified.
6	The appropriate incident classification is assigned or updated.
7	The classified incident becomes ready for IT support processing.

3. Classification Logic

The Flow Designer workflow uses predefined conditions to identify common IT incident types. For example, incidents mentioning Wi-Fi or connectivity can be classified as Network issues, password or login problems as Access issues, projector or device failures as Hardware issues, and slow computer problems as Performance issues.

Example Incident	Classification
Wi-Fi / Internet connectivity problem	Network
Password / Login problem	Access / Account
Projector / Device problem	Hardware
Computer running slowly	Performance

4. ServiceNow Components

- **Incident Management:** Receives and stores IT support incidents.
- **Flow Designer:** Automates the classification workflow.

- **Triggers:** Start the flow when a relevant incident is created or updated.
- **Conditions:** Compare incident information against predefined rules.
- **Actions:** Update the appropriate incident classification.

5. Benefits of the Proposed Solution

- Reduces manual classification effort.
- Provides consistent classification of common IT incidents.
- Speeds up initial ticket processing.
- Helps IT support staff focus on incident resolution.
- Can be extended with automatic assignment, notifications, and routing.

6. Expected Outcome

The proposed solution provides an efficient and scalable approach to IT helpdesk automation. By using ServiceNow Flow Designer, routine incident classification can be performed automatically, making the overall incident management process faster, more consistent, and easier to manage.
