

SOLUTION ARCHITECTURE

Auto Ticket Classification using Flow Designer

1. Architecture Overview

The solution uses the ServiceNow platform to automate the classification of IT helpdesk incidents. The architecture is centered around Incident Management and Flow Designer. A user creates an incident, the incident is stored in ServiceNow, and Flow Designer automatically evaluates the incident information and updates its classification according to predefined business rules.

2. High-Level Architecture

3. Architecture Components

Component	Responsibility
User	Submits an IT helpdesk incident describing the issue.
ServiceNow Incident Management	Creates, stores, and manages the incident record.
Flow Designer	Runs the automation workflow when the configured trigger occurs.

Component	Responsibility
Conditions / Business Rules	Evaluate incident details and identify the appropriate issue type.
Flow Actions	Update the incident with the appropriate classification.
IT Support Team	Uses the classified incident for efficient processing and resolution.

4. Data Flow

Incident Input: User-provided issue information such as the short description and incident details.

Processing: Flow Designer checks the configured conditions and determines the matching incident type.

Output: The incident record is updated with the appropriate classification for IT support processing.

5. Example Architecture Flow

Input	Processing	Output
"Wi-Fi is not connecting."	Flow Designer matches network-related condition.	Category: Network
"I forgot my password."	Flow Designer matches access-related condition.	Category: Access / Account
"Projector is not working."	Flow Designer matches hardware-related condition.	Category: Hardware

6. Security and Scalability

The solution operates within the ServiceNow platform and uses configured access permissions and workflow rules. The classification rules can be extended as new incident types are introduced. Additional Flow Designer actions can also be added later for automatic assignment, notifications, escalation, or routing.

7. Architecture Outcome

The architecture provides a simple, low-code, and scalable approach to automating incident classification. It connects the user, ServiceNow Incident Management, Flow Designer automation, classification rules, and IT support into a single workflow.
