

USER ACCEPTANCE TESTING

Auto Ticket Classification using Flow Designer

1. Purpose

User Acceptance Testing (UAT) is performed to verify that the automated ticket classification solution meets the expected needs of IT helpdesk users. The testing confirms that incidents can be created normally, the Flow Designer automation executes as expected, and the appropriate classification is applied without manual intervention.

2. UAT Objectives

- Verify that users can create IT incidents successfully.
- Verify that the automation classifies common incident types correctly.
- Confirm that the updated classification is visible on the incident record.
- Confirm that manual classification is not required for configured scenarios.
- Validate that the solution supports the intended IT helpdesk workflow.

3. User Acceptance Test Cases

UAT ID	User Scenario	Expected Result	Acceptance
UAT-01	User creates an incident for a Wi-Fi/connectivity problem.	Incident is created and automatically classified as Network.	Accepted
UAT-02	User reports a forgotten password or login problem.	Incident is automatically classified as Access / Account.	Accepted
UAT-03	User reports a projector or device failure.	Incident is automatically classified as Hardware.	Accepted
UAT-04	User reports that a computer is running slowly.	Incident is automatically classified as Performance.	Accepted
UAT-05	User creates an application/software-related incident.	Incident is classified according to the configured Software rule.	Accepted
UAT-06	User creates multiple incidents with different issue types.	Each incident is processed using its matching classification rule.	Accepted

4. UAT Procedure

1. Log in to the ServiceNow Developer Instance.
2. Open the Incident Management module.
3. Create a new incident using one of the test scenarios.
4. Submit the incident.
5. Allow the configured Flow Designer workflow to execute.
6. Review the incident record and verify the classification.
7. Repeat the test for other incident types.
8. Record whether the user requirement has been satisfied.

5. User Acceptance Criteria

Acceptance Criterion	Expected Outcome
Incident creation	Users can create incidents without errors.
Automatic processing	Configured incidents trigger the Flow Designer workflow.

Acceptance Criterion	Expected Outcome
Correct classification	The appropriate category is assigned based on the configured rule.
No manual classification	Users or support staff do not need to manually classify configured incidents.
Usability	The workflow fits naturally into the existing ServiceNow incident process.
Consistency	Similar incidents receive consistent classifications.

6. UAT Result

The User Acceptance Testing confirms that the proposed solution supports the intended helpdesk workflow. For the configured test scenarios, users can create incidents and the system can automatically classify them according to the defined rules. This demonstrates that the solution meets the primary user requirements.

7. Acceptance Statement

The Auto Ticket Classification using Flow Designer solution is accepted for the demonstrated use cases because it provides automated, consistent, and efficient classification of IT helpdesk incidents.

8. Future Enhancements

The solution can be extended with automatic assignment to support groups, email or platform notifications, priority-based routing, escalation, additional classification rules, and more advanced text-based classification.
